

GULFSTREAM SERVICES

Wireless Actuation System

Gulfstream Services' wireless actuated cement head assembly eliminates trips in the riding belt during cementing operations and simultaneously eliminates the use of bulky and performance-limiting hydraulic or pneumatic-based actuation systems.

Using military-based FHSS (frequency hopping spread spectrum) bandwidth technology, the Wireless Actuation System (Atex and Class 1 Div 1 approved) allows for on-demand launching of objects in 1 second and an integrated electrical safety sequence system. This ensures launching will not take place out of order. The assembly also has a manual back-up launching system and can operate kelly and plug valves on cement lines. It has extended battery power, allowing for 200 hours of operation.
